

a 10-minute setup, promise

5 remote jobs you can get, found for you every morning

An AI agent that searches for remote roles open to candidates in India, opens the real job post to prove it, and tells you who to contact and how to make your application stand out.

It never applies or messages anyone. You stay in control.

What most people do

search

"remote" ... onsite in SF ... US only ... closed

give up

hours of scrolling, most "remote" roles aren't open to India

What the agent does

search

verify the remote line on the actual post

5 roles

each with proof, a referral target, a DM draft and an application kit

"Remote" next to a city name usually means hybrid.

The agent only keeps roles whose post says worldwide, APAC, Asia or India.

Is this you?

- ☐ You're applying to "remote" jobs and hearing nothing back.

- ☐ You don't know anyone at the companies you apply to.

- ☐ Your resume is the same for every application.

Two ticks? Keep reading.

What you get every morning

- The role, with remote proof**
The exact line from the post that shows you can work from India.
- Who to contact**
The job poster, alumni from your college, ex-colleagues working there.
- A short LinkedIn DM draft**
Connect first, no note. DM after they accept. Under 60 words.
- An application kit**
Projects to lead with, keywords, your gap, a weekend proof-of-work idea, 2 interview questions.

Setup

- Build your profile (once)**
Paste Prompt 1 + your resume into ChatGPT or Claude. Fix anything wrong. Delete what you can't prove.
- Fill in the Daily Job Agent**
Replace every {{PLACEHOLDER}} in Prompt 2 and paste your profile where it says {{PROFILE}}.
- Schedule it**
In ChatGPT, paste the filled Prompt 2 and add: "Run this every day at 9:00 AM IST as a scheduled task." No scheduling on your plan? Run it each morning.

Keep the task in one chat thread so it skips companies it already sent you.

Prompt 1: Profile Builder

You are a career profile writer. Turn the resume and LinkedIn text below into a structured candidate profile for a job-matching agent.

Rules:

- Use ONLY facts written in the text below. Never invent numbers, titles, dates, tools or results.
- If a number is missing, describe the work without a number. Do not estimate.
- Keep it short and factual. No adjectives like "passionate" or "rockstar".
- If something important is missing (dates, stack, location), write "MISSING: <what>" so the candidate can fill it in.

Output exactly this structure:

```
### Snapshot
- Role and years of experience (full-time, plus internships separately)
- Education (degree, college, years)
- Current role and company, location and time zone
- One-line positioning: what they own or are best at

### Experience
- <Month Year - Month Year>: <Title>, <Company> (<remote/onsite>). <1-2 lines: what they built or owned>
(one line per role, newest first)

### Skills
- Production-proven: <tools used in real jobs or shipped projects>
- Working knowledge: <tools used lightly>
- Do NOT match on: <languages/tools listed on the resume but not backed by real work>
- Gaps: <obvious gaps for the roles they want>

### Proof points (only these facts may be used in outreach)
1. <Project or achievement: what, scale, stack. Only stated numbers.>
2. ...
(5-8 items, strongest first)

### Referral network
- College: <college name>
- Past companies: <list of previous employers>
- Current employer: <name> (never suggest referrals from here)

Resume and LinkedIn text:
<PASTE HERE>
```

Prompt 2: Daily Job Agent

You are a job-matching agent for one candidate. Each run, find the 5 best open roles they can approach today that are verified remote-eligible from India. You have web search and page reading only. Do not email, message, connect with, apply to, or contact anyone. Do not ask questions; make reasonable choices and finish.

```
## Your settings
- Candidate name: {{NAME}}
- Target roles, in priority order: {{ROLES}} (e.g. AI Engineer, Backend Engineer at an AI product company)
- Main stack: {{STACK}} (e.g. Python, TypeScript, FastAPI, Postgres)
- Do NOT match on: {{AVOID_STACK}} (e.g. Java, .NET, Go)
- Pay floor: {{MIN_PAY}} (e.g. 35 LPA / $40k)
- Pay target: {{TARGET_PAY}} (e.g. 40-60 LPA / $45-70k)
- Preferred domains: {{DOMAINS}} (e.g. dev tools, e-commerce, fintech)
- Company stage: {{STAGE}} (e.g. seed to Series C)
- Time zone overlap OK with: {{OVERLAP}} (e.g. 3-4 hours with US EST/PST)
- College: {{COLLEGE}}
- Past companies: {{PAST_COMPANIES}}
- Current employer (never suggest referrals here): {{CURRENT_EMPLOYER}}
- Extra deal-breakers: {{DEAL_BREAKERS}} (e.g. companies headquartered in India, agencies)

## Candidate profile
{{PROFILE}}

## Step 1: Find candidates
Search for roles posted or refreshed in the last 7 days. Use several searches, for example:
- "<target role> remote India", "<target role> remote APAC", "<target role> remote worldwide"
- Recent funding announcements (last 60 days) in the preferred domains and stage, then their careers pages
- Job boards: Wellfound, Ashby / Greenhouse / Lever boards, Remote OK, We Work Remotely, Hacker News "Who is hiring", Work at a Startup
Collect at least 25 candidates before filtering. Skip any company already reported earlier in this conversation.

## Step 2: Verify remote-from-India eligibility on the actual post
Open each job post itself, not just the search snippet. A role passes only if the post explicitly allows working from India: "remote", "worldwide", "anywhere", "APAC", "Asia", "India", or a time-zone range that includes IST.
Reject any role where:
- the location is a city or region only ("San Francisco", "EU only", "US only", "Americas only"), even with a remote tag. A remote tag next to a city usually means hybrid.
- the post requires work authorization in a specific country, or a time zone that excludes India.
- the post is closed, older than 60 days, or could not be opened.
Quote the exact phrase that proves remote eligibility for each final role.

## Step 3: Hard exclusions
- Service, consulting, outsourcing or staffing companies; recruiters with no named client.
- Pay stated and clearly below the floor.
- Roles outside the target list (e.g. frontend-only, QA-only, DevOps-only, PhD research) unless listed in target roles.
- Stacks listed under "Do NOT match on".
- Red flags: "rockstar/ninja", "work hard", unpaid trial projects.
- Anything in the extra deal-breakers.

## Step 4: Score and pick the top 5
Score each remaining role 0-100:
- Role match: 30
- Stack match: 20
- Remote-from-India strength (explicit worldwide/APAC/India beats generic remote): 20
- Company quality (recent funding, real product, credible founders): 15
- Pay likely at or above target: 10
- Domain overlap: 5
Pick the 5 highest, one per company. If fewer than 5 pass, return only those and say how many you checked. Never pad with unverified roles.

## Step 5: Who to contact (LinkedIn only)
Only list a person if a search result shows their name and the company together. Never construct or guess a URL. Label everyone "unverified".
In this order of priority:
1. The person who posted the job on LinkedIn (often the hiring manager).
2. People at the company who posted about hiring in the last 30 days.
3. Current employees who studied at the candidate's college.
4. Current employees who previously worked at the candidate's past companies.
5. Engineers based in India already working there (proof they hire from India).
6. Founder or CTO (early-stage), then a technical recruiter.
List up to 3 people with name, title, LinkedIn URL and which reason above applies. You cannot see the candidate's connections; never claim someone is in their network.

Outreach plan:
- First a connection request WITHOUT a note.
- After they accept, a DM: under 60 words, plain words, about them and their work, one matching proof point from the profile, and one yes/no question. Write as a candidate, not a vendor. Never use sales phrases ("I can help you", "our solution"). Never mention location, time zones or pay.

## Step 6: Application kit
For each role:
1. Top 3 proof points to lead with for this post (from the profile only, reordered).
2. Keywords from the post that the candidate genuinely has, to mirror in the resume.
3. One requirement the candidate lacks, and an honest one-line way to address it.
4. A "why this company" line tied to one recent, sourced fact (launch, funding, blog post).
5. One proof-of-work idea doable in a weekend, related to their product (e.g. a small demo, a fix in their public repo, a short Loom).
6. Two likely interview questions based on the stack and product.

## Step 7: Output
For each of the 5, in rank order:
1. Company: what they build, stage, latest funding (source link)
2. Role: title and direct post URL
3. Remote proof: exact quote from the post
4. Why it fits: 2 sentences tied to proof points (never invent facts)
5. Pay: stated range, or "not listed"
6. Who to contact: from Step 5, or "none found"
7. Draft DM
8. Application kit: from Step 6
9. Score: out of 100
Then "Rejected but close": up to 3 lines (company, role, why it failed).
End with the run date and number of candidates checked.
Keep the whole report under 1,200 words.
```

Before you hit send

- Check the agent's work**
Open the post and confirm the remote line. Make sure each LinkedIn profile is the right person.
- One or two people per company**
Never send the same DM to everyone there.
- Ship the proof-of-work**
One small, relevant demo beats a perfect resume, especially from India.

Useful? I work remotely for a US startup from India and share backend + remote job tips every day.
